

CESI Internal Report

Water Survey of Canada

2021-09-03

Canadian Environmental Sustainability Indicators

Every other year, the Water Survey of Canada produces the Canadian Environmental Sustainability Indicators (CESI) that assess water quantity across Canada. As of 2021, there were over 2100 active stations collecting flow data in the hydrometric network, with most stations reporting real-time data. This document provides supplementary information about the indicator values for internal reference.

Supplementary Station Information

When CESI indicators are calculated, stations are removed from the analysis based on the historical flow data record, as well as the completeness of data for the current year. Flow values from the year of analysis are compared against a normal period of 1981-01-01 to 2010-12-31 (or 1981-01-01 to 2010-12-31 for Northern Quebec stations) in order to evaluate whether each daily value falls within the range of normal values for that date.

Stations are not used for the indicators if:

- there are less than 25 years of data within the 30 year normal period (for each day of the year),
- the number of days for the current year is less than 174 days for seasonal stations (of approximately 217 days overall),
- or the number of days for the current year is less than 292 for continuous stations (of 365 or 356 days).

Annual reporting station summary:

1. Year: 2019
2. Number of stations with flow data for analysis year: 1700
3. Percent of stations' dates with enough years in the normal period: 81.76
4. Number of stations with enough data in the normal period: 1125
5. Number of seasonal stations with at least 174 of 217 days: 300
6. Number of continuous stations with at least 292 of 365/6 days: 727
7. Final number of stations used for calculation of the indicators: 1027

HYDAT database version date: 2021-07

Local Water Quantity Indicator

CESI Local Water Quantity Indicator (2019)

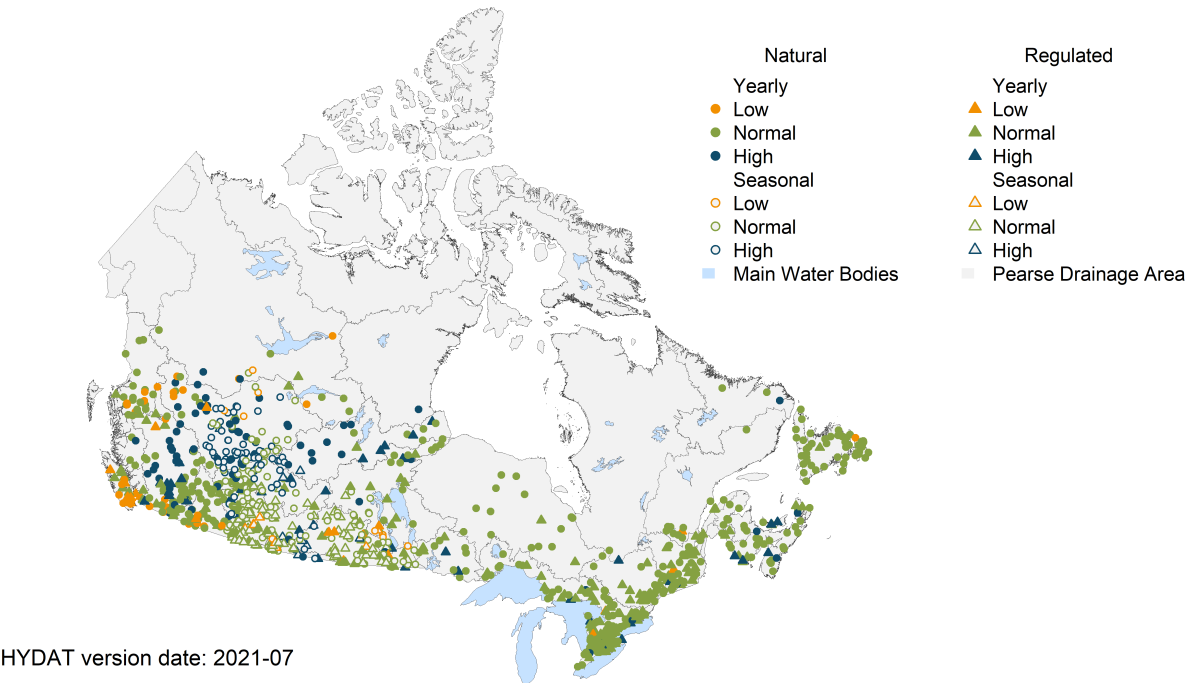

Figure 1: Local indicator map with hydrometric station points across Canada

Regional Water Quantity Indicator

Water Quantity Status of Drainage Regions (2019)

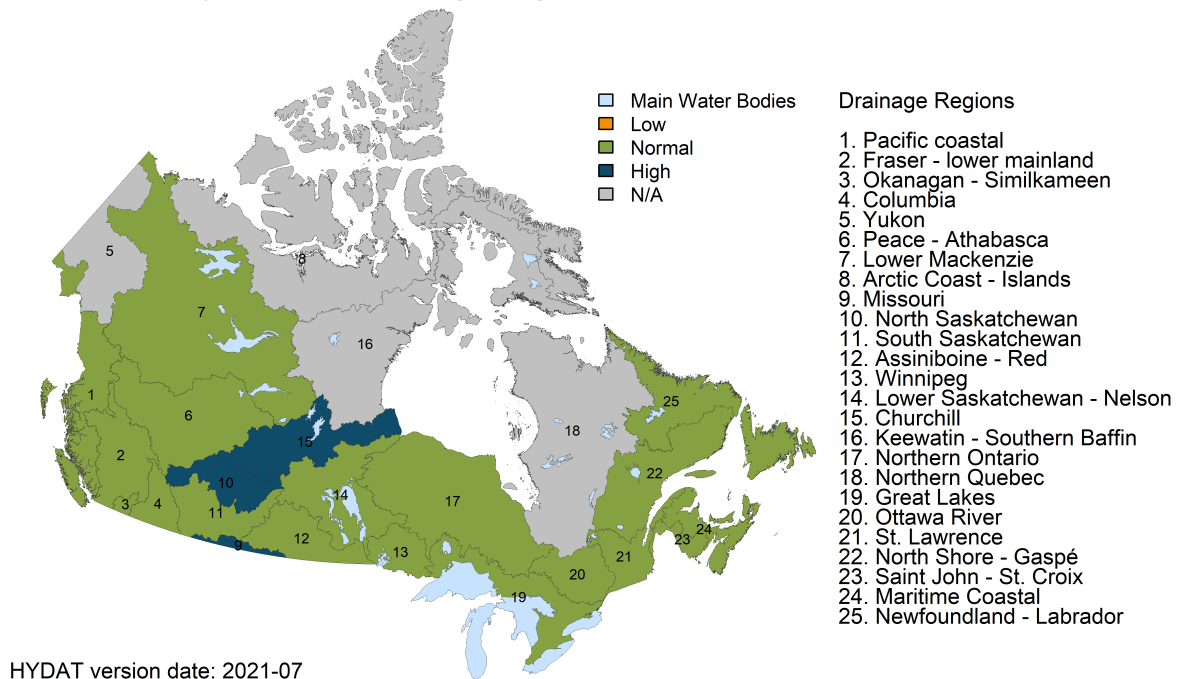

Figure 2: Regional indicator map with based on most downstream stations in each Pearse Drainage Region

Station summary by Pearse Drainage Area

This table summarizes the number and types of stations per Pearse Drainage Area that were used for 2019 to calculate the local indicator (Con = Continuous, Seas = Seasonal, Reg = Regulated, Nat = Natural).

Pearse Drainage Area	# of Stations	Con/Nat	Con/Reg	Seas/Nat	Seas/Reg
Assiniboine - Red	80	4	21	27	28
Churchill	25	13	6	5	1
Columbia	44	38	6	0	0
Fraser - lower mainland	61	39	22	0	0
Great Lakes	156	73	82	0	1

Downstream Stations Summary for 2019

- (1) Pearse Drainage Area (PDA)
- (2) Flow type in 2019
- (3) PDA total drainage area (m³)
- (4) Proportion of area gauged by all classes (Low, Normal, High)
- (5) Number of downstream stations classified as “Low” for PDA
- (6) Proportion of area in PDA gauged by “Low” stations
- (7) Number of downstream stations classified as “Normal” for PDA
- (8) Proportion of area in PDA gauged by “Normal” stations
- (9) Number of downstream stations classified as “High” for PDA
- (10) Proportion of area in PDA gauged by “High” stations

National Water Quantity Indicator

2019 Station Classifications

Figure 3: Overall classifications for all hydrometric stations in Canada in analysis year

Appendix 1

This is the list of hydrometric stations that collected flow data in the year of analysis, and were included in the calculations of the local, regional, and national CESI indicators. The stations are grouped in the 25 Pearse Drainage Areas of Canada.

(1) Pacific Coastal drainage area

Station Number	Water Quantity	Water Flow	Sampling Frequency	Drainage Area
08CD001	Normal	FALSE	Continuous	3550.0
